

Lab 4 - Vibe Coding: Complete LLM Chat History

Name: Samvith Vaddiparthi | SRN: PES1UG24AM468 | Section H | Scenario 19 - Battleship vs AI
LLM used: Claude (Claude Code desktop app, model Claude Opus 5.5). Long tool outputs are truncated for readability.

Student (Samvith)

https://github.com/RuthuHK/software-engineering-lab-material_sec_h/blob/main/Sec_H_Scenarios_assigned.xlsx

this is the github link, my scenario is 64, finish the lab

u have to record some videos of some before and after, is it mentioned anywhere in the instructions in the github? Imk before u finish the full thing, also use name: Samvith Vaddiparthi , SRN: PES1UG24AM468

Tool call: Bash

```
# Clone lab repo and list its files
ls -la && git clone --depth 1 https://github.com/RuthuHK/software-engineering-lab-material_sec_h.git 2>&1 | tail -2 && find software-engineering-lab-material_sec_h -not -path '*/.git*' | head -100
```

Lab 4: VibeCoding

Objective

Use Vibe Coding tools to fix the broken code and add features to the same. Learn how to prompt to get the job done in under three to four attempts. Clone a repo assigned to you, make changes and push to your repo in your personal account.

THIS IS AN INDIVIDUAL ASSIGNMENT. WORK INDIVIDUALLY!!

Duration

60 minutes

Software Requirements

- Access to Vibe Coding tool. (ChatGPT, Gemini, Claude etc)

Instructions:

1. Go to the repo assigned to you
2. Go through the ReadMe file to understand the deliverables
3. Clone or Fork the repo
4. Run the Python based code (A game/ A Puzzle)
5. Record 10 seconds of video before making any changes.
6. Write prompts and fix the broken code
7. Write prompts to add all the features listed in the ReadMe file of the repo one by one.
8. Record another 10 seconds of video again after making all the changes.
9. Push the code to your repo.
10. Have Separate Commits for each task
11. Do not raise PR to the main repo (SETAPESU26)

Deliverables:

Upload the following to your Lab repo under Lab-4 folder,

- a. Videos (before and after)

# Scenario 19 – Battleship vs AI
```

A terminal Battleship game with separate board and AI modules.

Provided files

- `main.py` – entry point.
- `game.py` – turn flow and setup.
- `board.py` – ship and shot state.
- `ai.py` – computer targeting.
- `requirements.txt` – dependency declaration.

Setup

```
```bash
python main.py
```
```

Before changing the code

Inspect how coordinates are represented in every module. Fire at known ship cells and known empty cells. Then trace an AI shot from selection to hit detection.

Task 1 – Consistent coordinate handling

Make coordinate representation consistent across input, ship placement, player shots, and AI shots so occupied cells are recognised correctly.

****Done when:**** every real ship coordinate is treated as a hit and every known empty coordinate is treated as a miss.

Task 2 – Complete fleet and win logic

Support multiple ships, track individual ship damage, identify sunk ships, prevent repeated shots, and end the game when the fleet is sunk.

Task 3 – Improve the AI

After a hit, make the AI preferentially consider nearby untried cells. It must never shoot the same coordinate twice and must handle a board with no remaining choices.

Task 4 – Shot-level feedback

Ensure hit/miss/sunk feedback occurs exactly once for

Claude

I've read the lab instructions but haven't changed any code yet. Before I start, there's a problem with which scenario to do.

Your Lab 4 repo is 19 (Battleship), not 64. In lab4/Section_H_Vibe_Coding_Assignments.xlsx the row for PES1UG24AM468 (VADDIPARTHI SAMVITH) gives **19** → https://github.com/SETAPESU26/19_battleship. Scenario 64 (64_fruit_catcher) is assigned to ADITYA SINGHAL (PES1UG24AM420). Your "64" comes from Sec_H_Scenarios_assigned.xlsx, which is the Lab 1–3 problem statement your ATM SRS was based on. I've downloaded both repos so I can do either one.

Yes, videos are required. Both the Lab 4 handout and the repo README say so: - Step 5: record a **10-second video before** making any changes, showing the bug. - Step 8: record a **10-second video after** all the changes, showing the fix and the new features working.

Everything else you need to hand in, from the handout: - Upload to your own Lab repo, inside a Lab-4 folder: (a) the before and after videos, (b) the updated code, (c) your chat history exported as a doc or PDF. - Make a **separate commit for each task**, and push to your personal repo. **Don't raise**

a PR to SETAPESU26. - The Battleship README lists 4 tasks: (1) use the same coordinate format everywhere, so real ship cells count as hits; (2) multiple ships, sunk ships, no repeat shots, and a win condition; (3) the AI aims at cells next to a hit, never fires twice at the same cell, and copes when no cells are left; (4) hit/miss/sunk messages print exactly once per real shot. It also lists required tests.

Before I finish it, I need two things from you: 1. **Battleship (19) or Fruit Catcher (64)?** I'd go with 19 because that's what the sheet assigns you, unless your instructor told you otherwise. 2. **Your Lab repo URL.** The GitHub CLI (gh) isn't installed here and I can't find a local copy of your lab repo. If you don't have one yet, I can set up the Lab-4 folder locally with one commit per task, and you push it.

About the videos: Battleship runs in the terminal, so the easiest way is to record your screen yourself with Cmd+Shift+5 (about 10 seconds each). I'll give you the exact inputs that show the bug before the fix and the features after it. I can't record them with what's installed: there's no ffmpeg and no terminal recorder. If you'd rather I generate them, I'd need to install ffmpeg with Homebrew.

I'll also use **Samvith Vaddiparthi / PES1UG24AM468** for the commit author and file names.

Student (Samvith)

yes i will push it, use 19, do it properly, no mistakes

Tool call: Bash

```
# Read all Battleship source files
cd /Users/samvithvaddiparthi/SE_Lab/lab4_19_battleship && for f in main.py game.py board.py
ai.py requirements.txt; do echo "==== $f"; cat -n $f; done; git log --oneline
```

OK
Battleship

Your shots are coordinates like 2,3.
Ship cells remaining: 3
> MISS!
AI fired at 3,1
AI missed.

Your shots are coordinates like 2,3.
Ship cells remaining: 3
> HIT!
AI fired at 5,4
AI missed.

Your shots are coordinates like 2,3.
Ship cells remaining: 2
> Already fired there.

Your shots are coordinates like 2,3.
Ship cells remaining: 2
> HIT!
AI fired at 6,6
AI missed.

Your shots are coordinates like 2,3.
Ship cells remaining: 1
> HIT!
You sank the fleet.

Claude

Task 1 tests pass, and the replay now behaves correctly. Committing Task 1:

Tool call: Bash

```
# Commit Task 1 and verify recorder install
printf '__pycache__/\n*.pyc\n' > .gitignore && git add -A && git commit -q -F - <<'EOF'
Task 1: Use one coordinate representation everywhere
```

All modules now use 0-based (row, col) tuples internally; 1-based "row,col" text is converted only at the input/output edge (new coords.py).

Fixes:

- AI.choose() returned 1-based text that game.py compared to 0-based ship cells, so AI cell (0,0) was reported as a hit and real ship cells as misses.
- AI shots were never recorded on the player's board.
- Repeat-shot check and "cells remaining" looked at the player's board instead of the enemy board, so the same cell could be hit repeatedly.
- Invalid input such as "1,2,3" or "a,b" is rejected with a clear message.

Adds tests/test_coordinates.py.

> HIT!

AI fired at 1,1
AI missed.

Your shots are coordinates like 2,3.
Enemy ships afloat: 1/3 | Your ships afloat: 3/3
> HIT!
You sank the enemy Patrol Boat!
You sank the fleet. You win!

Tool call: Bash

```
# Run all tests and commit Task 2
python3 -m unittest 2>&1 | tail -2 && git add -A && git commit -q -F - <<'EOF'
Task 2: Complete fleet, sinking, repeat-shot and win logic
```

- Ship class tracks its own cells and hits; Board keeps a fleet of ships.
- Each side now has three ships (Cruiser, Destroyer, Patrol Boat).
- Board.place_ship rejects overlapping, off-board, diagonal or broken ships.
- Board.fire returns a ShotResult (hit, sunk ship) and raises RepeatedShotError for a cell that was already fired at.
- Repeated or invalid player shots are rejected without using a turn.
- Sunk ships are announced; the game ends when either fleet is sunk (player win or AI win), on q/quit/exit, or on Ctrl+D/Ctrl+C.

Adds tests/test_fleet.py and shared test helpers.

Ran 32 tests in 0.071s

OK
 hunt/target avg shots to sink fleet: 23.23
 random avg shots to sink fleet: 32.586

Claude

All 32 tests pass. The new AI sinks the fleet in about 23 shots on average, versus about 33 for random firing. Committing Task 3:

Tool call: Bash

```

# Commit Task 3
git add -A && git commit -q -F - <<'EOF'
Task 3: Hunt/target AI that never repeats a shot

- AI.record() lets the AI learn from each shot's ShotResult.
- After a hit the AI prefers untried, on-board neighbours of that hit;
  once two hits line up it extends that line first.
- Hits on a sunk ship are dropped so the AI goes back to hunting.
- Every cell is tried at most once; choose() returns None when no cells
  are left and the game handles that without crashing.
- Optional rng argument makes the AI reproducible in tests.

Average shots to sink the enemy fleet over 500 games: 23.2 (was 32.6
with random-only firing).

Adds tests/test_ai.py.

# Commit Task 4
git add -A && git commit -q -F - <<'EOF'
Task 4: Announce each real shot exactly once

- One feedback line per actual shot, built in one place
  (Battleship.shot_message / _take_shot), e.g.
  "You fire at 3,5: HIT! You sank the enemy Cruiser!" or
  "AI fires at 1,2: miss."
- AI target selection (choose) and Board stay silent; feedback is only
  printed after Board.fire resolves a shot, so it always matches the board.
- AI misses are now reported too (previously only hits were).
- Rejected input (invalid, off-board, repeated) prints a reason but never
  a hit/miss message and never uses a turn.
- Side-by-side board display shows hits (X), misses (o), sunk ships (#)
  and your own ships (S), plus ships afloat for each side.

Adds tests/test_feedback.py.

## Solution notes – Samvith Vaddiparthi (PES1UG24AM468)

### Original defects found
- `ai.py` returned 1-based text (`"1,1"`) that `game.py` compared to 0-based ship
  cells, so the AI "hit" empty cells and missed real ones. AI shots were also never
  recorded on the player's board, so the AI could never win.
- The repeated-shot check and "Ship cells remaining" looked at the player's board
  instead of the enemy board: the same cell could be fired at (and "HIT") again and
  the remaining count never went down.
```

```

#### What changed (one commit per task)
Task	Change
1	`coords.py` is the single source of truth: 0-based `(row, col)` tuples everywhere,
converted to/from 1-based `row,col` text only at input/output.	
2	`Ship` objects with per-ship hits, 3 ships per side, placement validation, `ShotResult`
with sunk ship, `RepeatedShotError`, win **and** lose conditions, `q`/`quit`/`exit`/Ctrl+D to	
quit.	
3	Hunt/target AI: after a hit it tries untried neighbours, follows a line after two hits,
forgets hits on sunk ships, never repeats a cell, returns `None` when no cells remain.	
4	Exactly one feedback line per real shot (`You fire at 3,5: HIT! You sank the enemy
Cruiser!`), silent AI selection, AI misses reported, side-by-side board display. |

Board key: `X` hit, `o` miss, `#` sunk ship, `S` your undamaged ship, `.` water.

#### Running the tests
Standard library only (no extra dependencies, no persistent storage):

```bash
python3 -m unittest -v
```

The tests cover hits, misses, repeated shots, sinking one ship, sinking all ships
(both sides), AI repeated-shot prevention, adjacent targeting after a hit, a board
with no choices left, invalid coordinates, quitting, and one-message-per-shot feedback.

#### Updated folder structure

Claude

The PDF looks right. Now putting together the Lab-4 deliverable folder:

Tool call: Bash

```
# Assemble Lab-4 deliverables folder and verify
S=/private/tmp/claude-503/-Users-samvithvaddiparthi-SE-Lab/955e8c0c-a13b-46f0-90de-f405d60e5574/scratchpad; cd /Users/samvithvaddiparthi/SE_Lab && mv lab4_19_battleship
19_battleship && L=Lab-4 && mkdir -p $L/videos $L/code && cp $S/rec/before.mp4
$L/videos/PES1UG24AM468_before.mp4 && cp $S/rec/after.mp4 $L/videos/PES1UG24AM468_after.mp4 &&
git -C 19_battleship archive HEAD | tar -x -C $L/code && cat > $L/README.md <<'EOF'
# Lab 4 - Vibe Coding

**Name:** Samvith Vaddiparthi
**SRN:** PES1UG24AM468
**Section:** H
**Assigned repo:** Scenario 19 - Battleship vs AI (https://github.com/SETAPESU26/19\_battleship)
**LLM used:** Claude (Claude Code, Claude Opus 5.5)

## Contents
Item	File
Video before changes (bugs visible)	`videos/PES1UG24AM468_before.mp4`
Video after changes (fixes + Tasks 1-4)	`videos/PES1UG24AM468_after.mp4`
Updated code	`code/`
Chat history (exported)	`PES1UG24AM468_Lab4_chat_history.pdf`

## Bugs shown in the before video
- The same cell (`3,3`) can be fired at twice and is counted as a HIT both times.
- "Ship cells remaining" stays at 3 even after hits (it checked the wrong board).
- The AI fires at `1,1` (empty) and the game says "AI scored a hit" - the AI's 1-based
  text was compared with 0-based ship cells. AI shots were never applied to the player's board.

## What the after video shows
- Side-by-side boards (`X` hit, `o` miss, `#` sunk, `S` your ship) and ships afloat.
- One feedback line per real shot, e.g. `You fire at 3,5: HIT! You sank the enemy Cruiser!`
- Repeated (`3,3`) and off-board (`9,9`) shots rejected without using a turn.
- AI hunt/target: after hitting `5,5` it tries the neighbouring cells and sinks the Destroyer.
- Three ships per side; the game ends with a win when the enemy fleet is sunk.

## Tasks (one commit each in the code repo)
1. Consistent coordinate handling (`coords.py`, 0-based tuples internally).
2. Fleet of ships, per-ship damage, sunk ships, repeated-shot prevention, win/lose.
3. Hunt/target AI that never repeats a cell and handles no remaining choices.
4. Hit/miss/sunk feedback exactly once per actual shot; AI selection is silent.

## Run
```bash
cd code
python3 main.py
python3 -m unittest -v # 39 tests, standard library only
```
EOF
cd $L/code && python3 -m unittest 2>&1 | tail -1 && cd .. && find . -type f | sort && git -C
../19_battleship log --format='%h %an <ae> %s' && git -C ../19_battleship statu

Claude

Removing the `__pycache__` folders the test run created, then a final check that you can still exit the game with `Ctrl+C`:

Tool call: Bash

```
# Clean caches and verify Ctrl+C handling
find code -name __pycache__ -type d -exec rm -rf {} + && find code -name '*.pyc' | wc -l; cd
/Users/samvithvaddiparthi/SE_Lab/19_battleship && python3 -c "
import builtins, game
def boom(p=''): raise KeyboardInterrupt
g=game.Battleship(input_func=boom); print('outcome:', g.run())" | tail -2; git status --short |
wc -l
```

▼ Tool output

```
0
You quit the game.
outcome: quit
0
```

Claude

Last step: re-exporting the chat so the PDF includes everything up to now.

Tool call: mcp__ccd_session_mgmt__export_transcript

```
{
  "session_id": "self"
}
```

▼ Tool output

Exported this session's transcript "Scenario 64 lab completion" to /Users/samvithvaddiparthi/Downloads/session-export-1791354914348.zip (7 MB, 7705029 bytes). The zip holds the conversation transcript, its subagent transcripts and session metadata, not the app's logs; nothing was uploaded.

Tool call: Bash

```
# Regenerate chat history PDF into Lab-4 folder
S=/private/tmp/claude-503/-Users-samvithvaddiparthi-SE-Lab/955e8c0c-a13b-46f0-90de-f405d60e5574/scratchpad; cd $S && rm -rf export && mkdir export && cd export && unzip -o -q /Users/samvithvaddiparthi/Downloads/session-export-1791354914348.zip && cd $S && python3 transcript_to_html.py export/transcript.jsonl chat.html && "/Applications/Google Chrome.app/Contents/MacOS/Google Chrome" --headless=new --disable-gpu --no-pdf-header-footer --print-to-pdf=/Users/samvithvaddiparthi/SE_Lab/Lab-4/PES1UG24AM468_Lab4_chat_history.pdf file://$S/chat.html 2>/dev/null; python3 -c "import pypdf;r=pypdf.PdfReader('/Users/samvithvaddiparthi/SE_Lab/Lab-4/PES1UG24AM468_Lab4_chat_history.pdf');print(len(r.pages),'pages')"; rm /Users/samvithvaddiparthi/Downloads/session-export-1791354843604.zip; ls -la /Users/samvithvaddiparthi/SE_Lab/Lab-4 /Users/samvithvaddiparthi/SE_Lab/Lab-4/videos
```

Claude

Lab 4 (Battleship, scenario 19) is done and ready for you to push. All 39 tests pass, and both videos are recorded.

1. Code repo: SE_Lab/19_battleship/ (push this as its own repo)

There's one commit per task, all authored as Samvith Vaddiparthi: - **Task 1:** coordinates now use one format everywhere. This fixes the AI's false hits, AI shots never landing on your board, and the repeat-shot and "remaining" checks looking at the wrong board. - **Task 2:** each side has 3 ships. Each ship tracks its own damage and announces when it sinks, repeated shots are rejected, the game ends when either fleet is sunk, and you can quit with q, quit, exit, Ctrl+D or Ctrl+C. - **Task 3:** after a hit, the AI fires at the cells next to it and keeps going along a line once it has two hits. It never fires at the same cell twice, and it copes when no cells are left. It now sinks the enemy fleet in about 23 shots on average, versus about 33 for random firing. - **Task 4:** each real shot prints exactly one hit/miss/sunk line, and the AI's target choice prints nothing. The boards are shown side by side. - A fifth commit adds notes to the README.

The tests in tests/ cover every case the README's "Required testing" section lists. I renamed the original remote to upstream, so a plain push can't go to SETAPESU26. To push, create an empty repo called 19_battleship on your GitHub account, then run:

```
cd ~/SE_Lab/19_battleship && git remote add origin https://github.com/<your-username>/19_battleship.git && git push -u origin HEAD:main
```

2. Lab repo folder: SE_Lab/Lab-4/ (copy this into your Lab repo) - videos/PES1UG24AM468_before.mp4 (**10.0 s**): made from the untouched original code. It shows 3,3 counted as a HIT twice, "Ship cells remaining: 3" never going down, and the AI "scoring a hit" at the empty cell 1,1. - videos/PES1UG24AM468_after.mp4 (**13.7 s**): the fixed game. It shows rejected repeat and off-board shots, the boards, sink messages, a win, and the AI hitting 5,5, trying the cells around it, then sinking your Destroyer. - code/: the final code. - PES1UG24AM468_Lab4_chat_history.pdf: this whole chat (37 pages), including every command and its output. It ends just before this final message, since the export can't include a reply that's still being written. Thinking blocks are left out, and long outputs are shortened. - README.md: your name, SRN, and what each file shows.

Things to check before you submit: - The after video is 13.7 s instead of 10. Everything only fit at a readable pace that way; tell me if you want a strict 10 s cut. - The "before" video was re-recorded until a run caught the AI's false hit, because the original AI fires at random and the bug doesn't show up every time. - The game's README asks for a "Chat/LLM used page link". This chat has no public link, so the PDF is the export. If you also need a link, you can get one from the Claude app.

Student (Samvith)
what shd i do now

Claude

Everything is built, so all that's left is to put it on GitHub. There are two parts.

Step 1: Push the Battleship code to a new repo

1. On github.com, click **New repository** and name it 19_battleship.
2. Make it **Public**, or Private if your instructor says so.
3. **Don't** tick "Add a README", ".gitignore" or "license". The repo has to be empty.
4. Copy the repo URL GitHub shows you, then run this with your username in place of <your-username>:

```
cd ~/SE_Lab/19_battleship && git remote add origin https://github.com/<your-username>/19_battleship.git && git push -u origin HEAD:main
```

1. Refresh the GitHub page. You should see **6 commits**: the original one, Task 1 to Task 4, and the README one.

If it asks for a password, GitHub needs a **Personal Access Token**, not your account password. You make one under Settings → Developer settings → Personal access tokens.

Step 2: Upload the Lab-4 folder to your Lab repo

This is the repo where you submitted Labs 1–3.

The easy way (browser): 1. Open your Lab repo on GitHub → **Add file** → **Upload files**. 2. In Finder, open SE_Lab, then drag the whole Lab-4 folder onto the page. 3. Click **Commit changes**.

If your Lab repo is cloned on your Mac, run this with your real path in place of <path-to-your-lab-repo>:

```
cp -R ~/SE_Lab/Lab-4 <path-to-your-lab-repo>/ && cd <path-to-your-lab-repo> && git add Lab-4 && git commit -m "Add Lab 4 - Vibe Coding (Battleship)" && git push
```

Step 3: Check it

- Open both videos in Lab-4/videos/ on GitHub and make sure they play.
- Make sure Lab-4/PES1UG24AM468_Lab4_chat_history.pdf opens.
- **Don't** open a Pull Request to SETAPESU26. The handout says not to.
- If your class submission form asks for links, send the 19_battleship repo link and your Lab repo's Lab-4 folder link.

If you send me your Lab repo URL, or tell me where it's cloned on your Mac, I can do Step 2 for you.

Student (Samvith)

https://github.com/samvithvaddiparthi-ship-it/PES1UG24AM468_scenario64_samvithV_SElab
this is the repo, push for me il give u the perms

Tool call: Bash

```

▼ Tool output

The user doesn't want to proceed with this tool use. The tool use was rejected (eg. if it was a file edit, the new_string was NOT written to the file). STOP what you are doing and wait for the user to tell you how to proceed.

Student (Samvith)

no wait

Claude

Okay, I've stopped. Nothing has been pushed, and nothing has changed on GitHub.

Where things stand on your Mac: - SE_Lab/lab_repo/ is a fresh clone of your Lab repo, still at your original commit with just Final_Submission_1.pdf. The only change is that I set your name and email for commits in that clone. - SE_Lab/19_battleship/ is the code repo, with the 4 task commits plus the README commit. - SE_Lab/Lab-4/ is the finished deliverables folder: both videos, the code, the chat PDF and a README.

The step you rejected would have: 1. Downloaded the full history of the original SETAPESU26 Battleship repo, which was read-only for that repo. 2. Copied the code into your Lab repo under Lab-4/code along with each task commit. 3. Added the videos, chat PDF and README in one more commit.

All of that was local only. Pushing would have been a separate step.

How do you want to go ahead? For example: - Upload the Lab-4 folder as a single commit, without the per-task history. - Put the per-task commits only in a separate 19_battleship repo. - Something

else, like a different folder name or layout.

Student (Samvith)

https://github.com/samvithvaddiparthi-ship-it/PES1UG24AM468_SElab
sorry , this is the repo to push to

Tool call: Bash

```
# Remove wrong clone and clone the correct lab repo

Claude

The local commits are ready, and the files match the Lab-4 folder exactly. I'll run the tests one more time from inside the repo, then push:

Tool call: Bash

```
# Run tests then push Lab-4 to GitHub
cd /Users/samvithvaddiparthi/SE_Lab/PES1UG24AM468_SElab/Lab-4/code && python3 -m unittest 2>&1 |
tail -1 && find . -name __pycache__ -exec rm -rf {} + ; cd ../.. && git status --short | wc -l
&& GIT_TERMINAL_PROMPT=0 git push origin main 2>&1 | tail -5
```

▼ Tool output

```
OK
0
To https://github.com/samvithvaddiparthi-ship-it/PES1UG24AM468_SElab.git
e76c6fa..79fd3b3 main -> main
```

Tool call: Bash

```
# Confirm push landed on GitHub
git fetch -q && git status -sb | head -1 && git ls-remote origin main && curl -s
https://api.github.com/repos/samvithvaddiparthi-ship-it/PES1UG24AM468_SElab/contents/Lab-4 |
python3 -c "import json,sys; [print(i['type'], i['name']) for i in json.load(sys.stdin)]"
```

▼ Tool output

```
Exit code 1
## main...origin/main

Claude

Your Lab 4 submission is now on GitHub: https://github.com/samvithvaddiparthi-ship-it/PES1UG24AM468_SElab. GitHub's main branch is at my latest commit (79fd3b3), and the 39 tests passed just before the push.

What's now in your repo, in a Lab-4/ folder next to your Lab 2 and Lab 3 PDFs: - **Videos:** videos/PES1UG24AM468_before.mp4 and videos/PES1UG24AM468_after.mp4. - **Code:** code/ has the fixed Battleship game and its tests. - **Chat history:** PES1UG24AM468_Lab4_chat_history.pdf. - **Summary:** README.md with your name, SRN, and what each file shows.

The commit history keeps a separate commit for each task, as the handout asks: Task 1, Task 2, Task 3, Task 4, then the README notes.

The old scenario64_samvithV_SElab repo was not changed on GitHub; I only deleted my local copy of it.

What's left for you: - **Check it in the browser:** open the link above and make sure both videos play. GitHub's preview can be fussy with videos; if it won't play one, use the Download button. - **Submit:** if your class asks for a link, give https://github.com/samvithvaddiparthi-ship-it/PES1UG24AM468_SElab/tree/main/Lab-4. - **Don't** open a Pull Request to SETAPESU26.

Student (Samvith)

the submission is just pushing to the repo. is eevrything done then?

Claude

Yes, everything the handout asks for is in your repo:

| Requirement | Status |
|--|---|
| Before video | ✅ Lab-4/videos/PES1UG24AM468_before.mp4 |
| After video | ✅ Lab-4/videos/PES1UG24AM468_after.mp4 |
| Updated code | ✅ Lab-4/code/ |
| Chat history as doc/pdf | ✅ Lab-4/PES1UG24AM468_Lab4_chat_history.pdf |
| Separate commit for each task | ✅ Task 1 to Task 4 are separate commits |
| Fix the bug and add all the features in the README | ✅ All 4 tasks done, 39 tests pass |

| Requirement | Status |
|---------------------|---------------|
| No PR to SETAPESU26 | ✅ None opened |

Two small things to check: 1. **Your repo may be private.** GitHub's public API couldn't see it, which usually means it's private. If it is, make sure your instructor or TA has access, or make it public if that's what your class does. 2. **The chat PDF stops before the push.** It was exported before you gave me the repo link, so the last few messages aren't in it. The handout asks for the complete chat, so if you want, I can re-export it and push the updated PDF. It's a 1-minute job.

Otherwise you're done.

Student (Samvith)

it is public yes, and ye pls fix that 2nd point
